

## UVA Light Sensor with I<sup>2</sup>C Interface

### DESCRIPTION

VEML6070 is an advanced ultraviolet (UV) light sensor with I<sup>2</sup>C protocol interface and designed by the CMOS process. It is easily operated via a simple I<sup>2</sup>C command. The active acknowledge (ACK) feature with threshold windows setting allows the UV sensor to send out a UVI alert message. Under a strong solar UVI condition, the smart ACK signal can be easily implemented by the software programming.

VEML6070 incorporates a photodiode, amplifiers, and analog / digital circuits into a single chip. VEML6070's adoption of Filtron™ UV technology provides the best spectral sensitivity to cover UV spectrum sensing. It has an excellent temperature compensation and a robust refresh rate setting that does not use an external RC low pass filter. VEML6070 has linear sensitivity to solar UV light and is easily adjusted by an external resistor. Software shutdown mode is provided, which reduces power consumption to be less than 1 μA. VEML6070's operating voltage ranges from 2.7 V to 5.5 V.

### FEATURES

- Package type: surface mount
- Dimensions (L x W x H in mm): 2.35 x 1.8 x 1.0
- Integrated modules: ultraviolet sensor (UV), and signal conditioning IC
- Converts solar UV light intensity to digital data
- Excellent UV sensitivity and linearity via Filtron™ technology
- Excellent performance of UV radiation measurement under long time solar UV exposure
- Excellent temperature compensation
- High dynamic detection resolution
- Standard I<sup>2</sup>C protocol interface
- Support acknowledge feature (ACK)
- Immunity on fluorescent light flicker software shutdown mode control
- Package: OPLGA
- Temperature compensation: -40 °C to +85 °C
- Floor life: 168 h, MSL 3, according to J-STD-020
- Output type: I<sup>2</sup>C bus
- Operation voltage: 2.7 V to 5.5 V
- Material categorization: for definitions of compliance please see [www.vishay.com/doc?99912](http://www.vishay.com/doc?99912)

### APPLICATIONS

- Solar UV indicator
- Cosmetic / outdoor sport handheld product
- Consumer products

**APPLICATION INFORMATION**

**Pin Connection with the Host**

VEML6070 is a cost effective solution for ultraviolet light sensing with I<sup>2</sup>C interface. The standard serial digital interface easily accesses “UV light intensity” digital data.

The additional capacitor near the V<sub>DD</sub> pin is used for power supply noise rejection. For the I<sup>2</sup>C bus design, the pull-up voltage refers to the I/O of the baseband due to the “open drain” design. The pull-up resistors for the I<sup>2</sup>C bus design are recommended to be 2.2 kΩ. The circuit diagram as an example is shown in figure 8.

Fig. 8 - Hardware Pin Connection Diagram

**Digital Interface**

VEML6070 contains a 8-bit command register written via the I<sup>2</sup>C bus. All operations can be controlled by the command register. The simple command structure enables users to easily program the operation setting and latch the light data from VEML6070. In figure 9, VEML6070 I<sup>2</sup>C command format description for reading and writing operation between the host and VEML6070 are shown. The white sections indicate host activity and the gray sections indicate VEML6070's acknowledgement of the host access activity.

Receive byte → read data from UVS

Send byte → write command to UVS

P = stop condition

Fig. 9 - VEML6070 Command Protocol

**Slave Address and Function Description**

The VEML6070 has one slave address used for write functions (command) and two slave addresses used for read functions (UV data LSB and MSB).

The 7-bit address for write functions is 38h = 0111000x resulting in a 70h = 01110000 8-bit address. The 7-bit addresses for read functions are 38h = 0111000x for the UV Data LSB and 39h = 0111001x for the UV data MSB. This results in a 71h = 01110001 and 73h = 01110011 8-bit address, respectively. The 7-bit address 39h should not be used for a write function.

**Command Register Format**

VEML6070 provides a command to set device operations and sensitivity adjustment. This command is 8-bit long and includes 4 parameter groups for programming. The command format descriptions and register setting explanations are shown in tables 1 and 2.

TABLE 1 - COMMAND REGISTER BITS DESCRIPTION							
COMMAND FORMAT							
Reserved		ACK	ACK_THD	IT		Reserved	SD
Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0	0	ACK	THD	IT1	IT0	1	SD
DESCRIPTION							
Reserved		Reserved					
ACK		Acknowledge activity setting					
ACK_THD		Acknowledge threshold window setting for byte mode usage					
IT		Integration time setting					
SD		Shutdown mode setting					

VEML6070.

The ACK or UVI interrupt function allows the UVI sensing system to perform data pooling based on the interrupt event. The system sensor manager does not need to do continual data pooling and this significantly reduced the MCU loading. The ACK signal can also be used as a trigger event for popping up a warning UVI message.

**Refresh Time Determination**

VEML6070’s refresh time can be determined by the RSET value. Cooperating with the command register setting, the designer has a flexible way of defining the timing for light data collection. The default refresh time is 1T, (IT1 : IT0) = (0 : 1). If the RSET value is changed, the default timing changes and the other parts in the register table also change by comparing itself with the default timing (refer to figure 7).

Table 4 is an example of two RSET resistors that show the timing table that the system designer can use a flexible way to determine the desired refresh time.

<b>TABLE 4 - EXAMPLE OF REFRESH TIME AND RSET VALUE RELATION</b>			
REGISTER	SETTING	REFRESH TIME	
		RSET = 300 kΩ	RSET = 600 kΩ
(IT1 : IT0)	(0 : 0) = ½T	62.5 ms	125 ms
	(0 : 1) = 1T	125 ms	250 ms
	(1 : 0) = 2T	250 ms	500 ms
	(1 : 1) = 4T	500 ms	1000 ms

The designer can decide the refresh timing range requirement first, then choose an appropriate RSET value for the timing range, and then write the correct value for the system application via I<sup>2</sup>C protocol.

RECOMMENDED STORAGE AND REBAKING CONDITIONS				
PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
Storage temperature		5	50	°C
Relative humidity		-	60	%
Open time	Rebaking process should be done when aluminized envelope reopened	-	-	
Total time	From the date code on the aluminized envelope (unopened)	-	6	months
Rebaking	Tape and reel: 60 °C	-	22	h
	Tube: 60 °C	-	22	h

**RECOMMENDED INFRARED REFLOW**

Soldering conditions are based on J-STD-020 C definition.

1. After opening the tape and reel, IR reflow process should be done
2. IR reflow profile conditions

IR REFLOW PROFILE CONDITION			
PARAMETER	CONDITIONS	TEMPERATURE	TIME
Peak temperature		255 °C + 0 °C / - 5 °C (max.: 260 °C)	10 s
Preheat temperature range and timing		150 °C to 200 °C	60 s to 180 s
Timing within 5 °C to peak temperature		-	10 s to 30 s
Timing maintained above temperature / time		217 °C	60 s to 150 s
Timing from 25 °C to peak temperature		-	8 min (max.)
Ramp-up rate		3 °C/s (max.)	-
Ramp-down rate		6 °C/s (max.)	-

3. Recommend Normal Solder Reflow is 235 °C to 255 °C

Fig. 14 - VEML6070 A3OP Solder Reflow Profile Chart

**RECOMMENDED IRON TIP SOLDERING CONDITION AND WARNING HANDLING**

1. Solder the device with the following conditions:
  - 1.1. Soldering temperature: 400 °C (max.)
  - 1.2. Soldering time: 3 s (max.)
2. If the temperature of the method portion rises in addition to the residual stress between the leads, the possibility that an open or short circuit occurs due to the deformation or destruction of the resin increases.
3. The following methods: VPS and wave soldering, have not been suggested for the component assembly.
4. Cleaning method conditions:
  - 4.1. Solvent: methyl alcohol, ethyl alcohol, isopropyl alcohol
  - 4.2. Solvent temperature < 45 °C (max.)
  - 4.3. Time: 3 min (min.)
