CYV15G0103EQ

Prosumer Video Cable Equalizer

Features

- Multi rate adaptive equalization
- Operates from 143 to 1485 Mbps serial data rate
- SMPTE 292M, SMPTE 344M, and SMPTE 259M compliant
- Supports DVB-ASI at 270 Mbps
- Maximum cable length adjustment for HD-SDI and SD-SDI data rates
- Carrier detect and mute functionality for HD-SDI and SD-SDI data rates
- Equalizer bypass mode
- Seamless connection with HOTLink II™ family
- Equalizes up to 175m of Belden 1694A and Canare L-5CFB coaxial cable at 270 Mbps
- Equalizes up to 70m of Belden 1694A and Canare L-5CFB coaxial cable at 1.485 Gbps
- Low power: 160 mW at 3.3V
- Single 3.3V supply
- 16-pin quad flat Pb-free (QFN) package
- 0.18 μm CMOS technology
- Pb-free and RoHS compliant
- Pin compatible to existing QFN equalizer devices
- Uses Cypress CLEANLink™ technology

Functional Description

The CYV15G0103EQ is a multi rate adaptive equalizer designed to equalize and restore signals received over 75Ω coaxial cable. The equalizer meets SMPTE 292M, SMPTE 344M, and SMPTE 259M data rates. The CYV15G0103EQ is optimized to equalize up to 175m of Belden 1694A and Canare L-5CFB coaxial cable at 270 Mbps and up to 70m of Belden 1694A and Canare L-5CFB coaxial cable at 1.485 Gbps. This device is mainly targeted for Prosumer Video applications where the cable length requirements are not as stringent as professional broadcast video applications. The CYV15G0103EQ connects seamlessly to the HOTLink II family of transceiver devices.

The CYV15G0103EQ has DC restoration to compensate for the DC content of the SMPTE pathological patterns. The maximum cable length adjust (MCLADJ) sets the approximate maximum cable length to equalize at SD and HD data rates. The CYV15G0103EQ's differential serial outputs (SDO, SDO) mute, when carrier detect (CD) is tied to MUTE and when the approximate cable length set by MCLADJ is reached. The MUTE pin controls muting of the equalizer outputs at HD and SD data rates.

Power consumption is typically 160 mW at 3.3V.

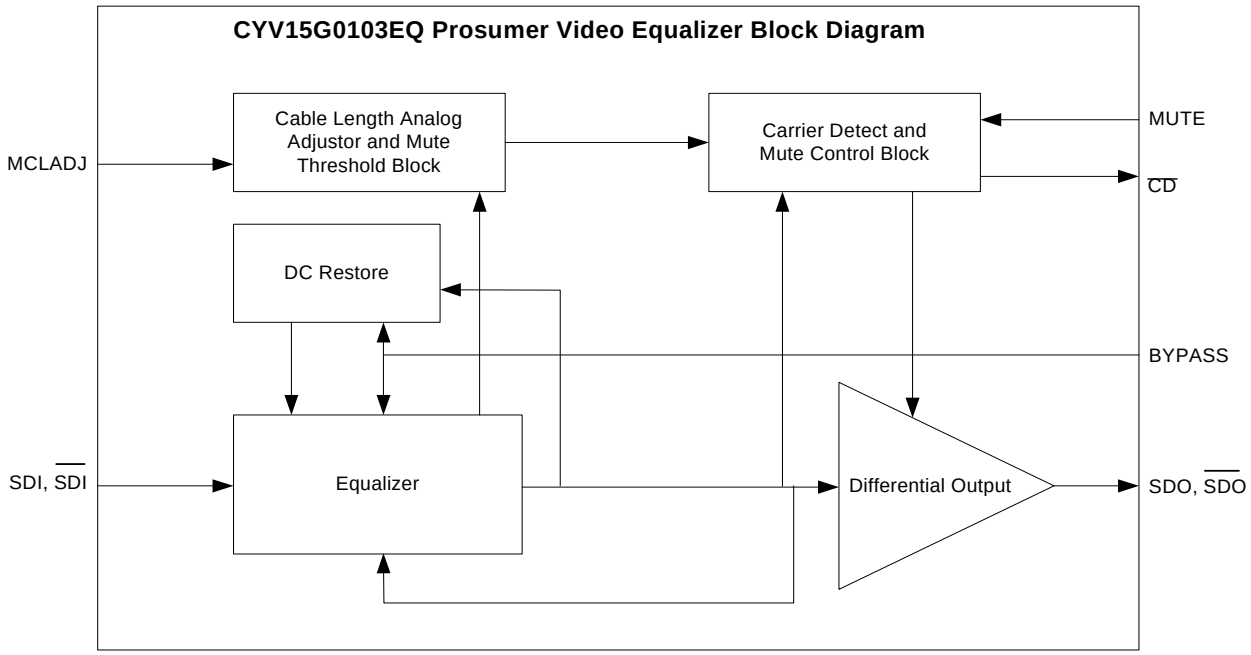
Equalizer Block Diagram



Pinouts

Figure 1. Pin Diagram - 16-PIN QFN Top View)

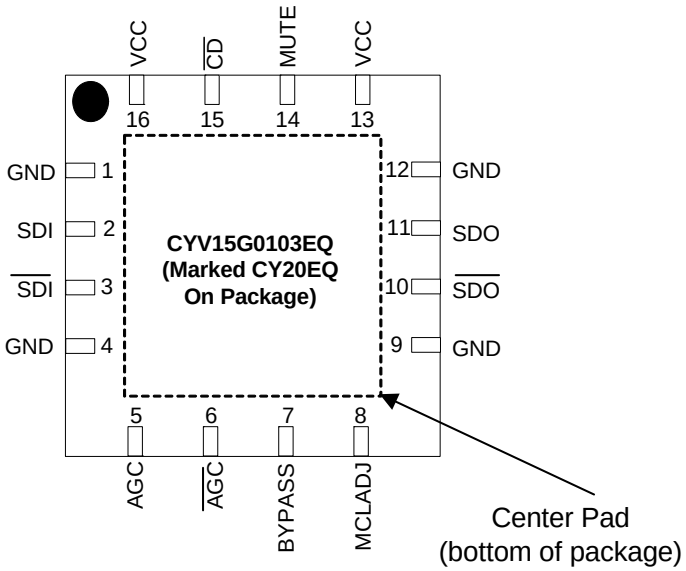


Table 1. Pin Descriptions - CYV15G0103EQ Prosumer Video Cable Equalizer

Name	IO Characteristics	Signal Description
Control Signals		
MUTE	LVTTL Input	**Mute.** When the MUTE pin is set LOW, the equalizer's differential serial outputs are not muted. When the MUTE pin is set HIGH, the equalizer's differential serial outputs are muted. BYPASS setting is ignored when MUTE is HIGH. Connecting $\overline{CD}$ to the MUTE pin enables automatic muting of the equalizer when the signal is lost. Do not leave an unused MUTE pin floating. Always drive it to a known state.
$\overline{CD}$	LVTTL Output	**Carrier Detect.** When the incoming data stream is present and maximum cable length does not exceed that set by MCLADJ, $\overline{CD}$ outputs a voltage less than 0.8V. When the incoming data stream is not present or maximum cable length exceeds that set by MCLADJ, $\overline{CD}$ outputs a voltage greater than 2.8V. Connecting $\overline{CD}$ to the MUTE pin enables automatic muting of the equalizer upon loss of signal.
MCLADJ	Analog Input	**Maximum Cable Length Adjust.** The maximum cable length to equalize is set by the voltage applied to the MCLADJ input. When the maximum cable length set by MCLADJ is reached, the $\overline{CD}$ indicator deasserts. If MCLADJ functionality is not needed, this pin should be left floating or tied to ground to allow maximum equalized cable length. MCLADJ works at both SD and HD data rates.
BYPASS	LVTTL Input	**Equalizer Bypass.** When BYPASS is set HIGH, the signal presented at the equalizer's differential serial inputs (SDI, $\overline{SDI}$) is routed to the equalizer's differential serial outputs (SDO, $\overline{SDO}$) without equalizing. When BYPASS is set LOW, the incoming video data stream is equalized and presented at the equalizer's serial differential outputs (SDO, $\overline{SDO}$). When the MUTE pin is set HIGH, the BYPASS setting is ignored and the serial outputs are muted.
AGC, $\overline{AGC}$	Analog	**Automatic Gain Control.** Place a capacitor of 1 μF between the AGC and $\overline{AGC}$ pins.
SDO, $\overline{SDO}$	Differential Output	**Differential Serial Outputs.** The equalized serial video data stream is presented at the SDO/$\overline{SDO}$ differential serial CML output.
SDI, $\overline{SDI}$	Differential Input	**Differential Serial Inputs.** SDI/$\overline{SDI}$ accepts either a single-ended or differential serial video data stream over 75Ω coaxial cable.
Power		
VCC	Power	**Power Supply for Device.** Connect to +3.3V DC.
GND	Gnd	**Connect to Ground.**
Center Pad	–	**Connect to PCB Ground for Maximum Thermal Dissipation.**

Equalizer Operation

The CYV15G0103EQ is a high speed adaptive cable equalizer designed to equalize standard definition (SD) and high definition (HD) serial digital interface (SDI) video data streams. The CYV15G0103EQ equalizer is optimized to equalize up to 175m of Belden 1694A and Canare L-5CFB cable at 270 Mbps and up to 70m of Belden 1694A and Canare L-5CFB cable at 1.485 Gbps. The CYV15G0103EQ equalizer contains one power supply and typically consumes 160 mW power at 3.3V. The multi rate equalizer meets the SMPTE 259M, SMPTE 292M, SMPTE 344M, and DVB-ASI video standards. It meets all pathological requirements for SMPTE 292M as defined by RP198 and for SMPTE 259M as defined by RP178. The CYV15G0103EQ multi rate cable equalizer operates from 143 Mbps to 1.485 Gbps serial data rate.

The CYV15G0103EQ equalizer has multiple variable gain equalization stages that reverse the cable attenuation effects. This equalization is achieved by separate regulation of the lower and higher frequency components in the signal to give a clean output eye diagram. The CYV15G0103EQ has DC restoration to compensate for the DC content of the SMPTE pathological patterns.

SDI, $\overline{\text{SDI}}$

CYV15G0103EQ accepts single-ended or differential serial video data streams over 75Ω coaxial cable. It is recommended to AC couple the SDI and $\overline{\text{SDI}}$ inputs because they are internally biased to 1.2V.

SDO, $\overline{\text{SDO}}$

The CYV15G0103EQ has differential serial output interface drivers that use Current Mode Logic (CML) drivers to provide source matching for the transmission line. These outputs are either AC coupled or DC coupled to HOTLink II receivers.

MCLADJ

Maximum Cable Length Adjust (MCLADJ) sets the approximate maximum amount of cable to be equalized. When the maximum cable length set by MCLADJ is reached, the $\overline{\text{CD}}$ pin deasserts. MCLADJ works at SD and HD data rates.

The graph in Figure 2 on page 7 illustrates the voltage required at the MCLADJ input to equalize various Belden 1694A cable lengths. The same graph applies for Canare L-5CFB cables.

If MCLADJ functionality is not needed, then this pin should be left floating or tied to ground to allow maximum equalized cable length.

MUTE

MUTE is an input pin that controls the muting of the equalizer's output. MUTE operates for both HD and SD data rates.

If MUTE is set LOW, the equalizer serial outputs are not muted. If MUTE is set HIGH, then the equalizer serial outputs are muted. When MUTE is active, the BYPASS setting is also ignored.

Connecting $\overline{\text{CD}}$ to MUTE enables automatic muting of the equalizer when the signal is lost.

Do not leave the MUTE pin floating. Always drive it to a known state.

Carrier Detect ($\overline{\text{CD}}$)

Carrier Detect is an active LOW output pin that indicates the presence of a valid incoming data signal. When the incoming data signal is present, and maximum cable length does not exceed that set by MCLADJ, $\overline{\text{CD}}$ outputs a voltage less than 0.8V.

When the incoming data stream is not present, or maximum cable length exceeds that set by MCLADJ, $\overline{\text{CD}}$ outputs a voltage greater than 2.8V.

Connecting $\overline{\text{CD}}$ to MUTE enables automatic muting of the equalizer upon loss of signal.

BYPASS

The CYV15G0103EQ has a bypass mode that enables the user to bypass the equalizer's equalization and DC restoration functions. When BYPASS is set HIGH, the signal presented at the equalizer's differential serial inputs (SDI, $\overline{\text{SDI}}$) is routed to the equalizer's differential serial outputs (SDO, $\overline{\text{SDO}}$) without performing equalization.

When BYPASS is set LOW, the incoming video data stream is equalized and presented at the equalizer's differential serial outputs (SDO, $\overline{\text{SDO}}$).

AGC

Place a 1 µF capacitor between the AGC and $\overline{\text{AGC}}$ pins of the CYV15G0103EQ equalizer.

Maximum Ratings

Exceeding maximum ratings may shorten the useful life of the device. These user guidelines are not tested.

Storage Temperature ..... –65°C to +150°C

Ambient Temperature with Power Applied ..... –55°C to +125°C

Supply Voltage to Ground Potential.....–0.5V to +3.8V

DC Voltage Applied to Outputs in High Z State ..... –0.5V to V_{CC} + 0.5V

DC Input Voltage ..... –0.5V to V_{CC} + 0.5V

Electro Static Discharge (ESD) HBM..... > 2000V (JEDEC EIA/JESD-A114A)

Latch Up Current ..... > 200 mA

Power Up Requirements

The CYV15G0103EQ contains one power supply. The voltage on any input or IO pin must not exceed the power pin during power up.

Operating Range

Range	Ambient Temperature	V_{CC}
Commercial	0°C to +70°C	+3.3V ±5%

DC Electrical Characteristics

Parameter	Description	Test Conditions	Min	Typ	Max	Unit
V_{CC}	Supply Voltage[1]	–	3.135	3.3	3.465	V
P_D	Power Consumption[2]	–	125	160	190	mW
I_S	Supply Current[1]	–	38	48	60	mA
V_{CMOUT}	Output Common Mode Voltage[1]	Load = 50Ω	–	$V_{CC} - \Delta V_{SDO}/2$ = 2.9	–	V
